

REMARKS

Favorable reconsideration of this application in light of the following discussion is respectfully requested.

Claims 141-143, 145-150, 152, 154 and 155 are pending in the present application. By this Supplemental Amendment, claims 150, 152, and 154 amended. The claim amendments are based on suggestions by SPE Calvin Hewitt during a personal interview conducted on June 23, 2011.

Personal Interview

Applicant acknowledges with appreciation the courtesies extended by Examiners Sherr, Nilforoush, Qayyum, Winter and Hewitt during the personal interview conducted with regard to this reissue Application and a number of related reissue applications. This supplemental amendment is being filed to amend claim 150 in accordance with suggestions made during that personal interview by Examiner Hewitt to avoid a rejection of claim 150 under 35 USC § 101, hereby placing this Application in better form for consideration on the merits of the Applicant's Request for Reconsideration.

CONCLUSION

Should there be any outstanding matters that need to be resolved in the present application, the Examiner is respectfully requested to contact Robert J. Webster (Reg. No. 46,472) at the telephone number of the undersigned below, to conduct an interview in an effort to expedite prosecution in connection with the present application.

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 02-2448 for any additional fees required under 37 C.F.R. §§ 1.16 or 1.17; particularly, extension of time fees.

Dated: JUL 26 2011

Respectfully submitted,
BIRCH, STEWART, KOLASCH & BIRCH, LLP

Attachment: Appnedix A – List Of All Claims

APPNEDIX A – LIST OF ALL CLAIMS

1-140. (Canceled)

141. (Previously Presented) An apparatus for processing digital data, the apparatus comprising:

a processor; and

a memory connected to the processor and including executable instructions that when executed by the processor, cause the processor to perform:

receiving digital data including a plurality of transport packets having a header and a scrambled data unit;

detecting a header of a first transport packet included in the plurality of transport packets;

extracting a marker from the header of the first transport packet;

extracting first control data from the extracted marker;

descrambling, using the same first control data and the same descrambler, both scrambled digital video and audio data included in the scrambled data unit of the first transport packet and one or more succeeding scrambled data units in the transport packets following the first transport packet; and

determining a number of transport packets that have been processed, and

when the processor determines the number of transport packets is a minimum of a multiple of four transport packets, the executable instructions further cause the processor to perform

detecting the header of a next transport packet included in the plurality of transport packets;

extracting a marker from the header of the next transport packet;

extracting second control data from the extracted marker; and

descrambling, using the same second control data and the same descrambler, both scrambled digital video and audio data included in the scrambled data unit of the next transport packet and one or more succeeding scrambled data units in the transport packets following the next transport packet.

142. (Previously Presented) The apparatus of claim 141, further comprising:

initializing the descrambler using the first and second control data for performing the descrambling operation.

143. (Previously Presented) The apparatus of claim 141, wherein the executable instructions further cause the processor to perform

descrambling each scrambled data unit, except for the header, in each of the plurality of data blocks.

144. (Canceled).

145. (Previously Presented) The apparatus of claim 141, wherein at least two of the scrambled data units and the header including the control data comprise one data group, the header including the control data, and

wherein the executable instructions further cause the processor to perform:

separating the at least two scrambled data units and the header from one data group before the descrambling.

146. (Previously Presented) The apparatus of claim 145, wherein the data group includes at least two packets, at least the first packet including one data unit and the header, and

wherein the executable instructions further cause the processor to perform:

demultiplexing the at least two packets from one data group.

147. (Previously Presented) The apparatus of claim 145, wherein the executable instructions further cause the processor to perform:

detecting the header from the received data group; and

detecting the control data within the header.

148. (Previously Presented) The apparatus of claim 145, wherein the data group further includes copy prevention information, the copy prevention information including one of current generation information and allowable generation information, the current generation information

indicating a number of times the digital data has been copied, and the allowable generation information indicating a number of permitted copies of the digital data, and

wherein the executable instructions further cause the processor to perform controlling a copy prevention function such that copying of the digital data is not permitted if the copy prevention information indicates that copying of the digital data is not permitted.

149. (Previously Presented) The apparatus of claim 141, wherein the descrambling of the scrambled digital units by the descrambler is performed only if the copy prevention information indicates that the copying of the digital data is permitted.

150. (Currently Amended) A data storage medium for storing executable instructions which are accessible and executable by a digital data processing apparatus including a descrambler, the data storage medium comprising:

a data area for storing digital data including a plurality of data blocks having a header and a scrambled data unit, the header in a first data block among the plurality of data blocks including first control data, one or more of the scrambled data units and the first control data being stored on the data storage medium, the first control data included in the first data block being used to descramble the first data block and a minimum of a multiple of four succeeding data blocks among the plurality of data blocks,

wherein when executed, cause the digital data processing apparatus to use the first control data ~~is used~~ for controlling a parameter of a descrambling operation performed by the descrambler of the digital data processing apparatus, and to use the same first control data ~~is used~~ for the first and the minimum of four succeeding scrambled data units,

wherein each of the scrambled data units includes scrambled digital video data or scrambled digital audio data stored on the data storage medium, wherein both the scrambled digital video data and the scrambled digital audio data are descrambled by the same descrambler, and

wherein after the minimum of the multiple of four transport packets have been descrambled, the descrambler is initializing based on second control data included in a different header of a corresponding data block for descrambling a different set of data blocks.

151. (Canceled).

152. (Currently Amended) The data storage medium of claim 150, wherein the descrambler is used to descramble each scrambled data unit is descrambled while not descrambling the header is not descrambled, in each of the plurality of data blocks.

153. (Canceled).

154. (Currently Amended) The data storage medium of claim 150, wherein at least two packets comprise one data group, at least a first packet including one scrambled data unit and the header, the header including the control data.

155. (Previously Presented) The data storage medium of claim 150, wherein the one or more scrambled data units and the control data comprise one data group, the data group further including copy prevention information, the copy prevention information including one of current generation information and allowable generation information, the current generation information indicating a number of times the digital data has been copied and the allowable generation information indicating a number of permitted copies of the digital data, and

the copy prevention information being used for a copy prevention function in a reproducing/reproducing/recording apparatus such a manner that copying of the digital data is not permitted if the copy prevention information indicates that the copying of the digital data is not permitted.
